Chapter: Is Matter Around Us Pure Class 9 CBSE

Exercise 2.1

1. What is meant by a substance?

Answer: A substance is a pure single form of matter. It has definite properties and compositions. Example: Iron

2. List the points of difference between homogeneous and heterogeneous mixtures.

Answer:

Homogeneous mixture	Heterogeneous mixture
Particles are uniformly distributed throughout the mixture	All the particles are completely mixed and can be distinguished with the bare eyes or under a microscope
Has a uniform composition	Irregular composition
No apparent boundaries of division	Noticeable boundaries of division

Exercise 2.2

1. Differentiate between homogenous and heterogeneous mixtures with examples.

Answer: The following are the differences between heterogeneous and homogenous mixtures.

Heterogeneous mixture	Homogeneous mixture
All the particles are completely mixed and can be distinguished with the bare eyes or under a microscope	Particles are uniformly distributed throughout the mixture
Irregular composition	Has a uniform composition
Noticeable boundaries of division	No apparent boundaries of division

A journey to achieve excellence	Chapter: Is Matter Around Us Pure	Class 9	CBSE

Examples: Seawater, blood, etc.	Examples: Rainwater, vinegar,
	etc.

2. How are sol, solution, and suspension different from each other?

Answer:

Attributes	Sol	Solution	Suspension
Type of mixture	Heterogeneous	Homogeneous	Heterogeneous
Size of particles	10 ⁻⁷ – 10 ⁻⁵ cm	Less than 1nm	More than 100nm
Tyndall effect	Exhibited	Not exhibited	May or may not be exhibited
Appearance	Usually glassy and clear	Unclouded and clear	Cloudy and opaque
Visibility	Visible with an ultramicroscope	Not visible	Visible with the naked eye
Diffusion	Diffuses very slowly	Diffuses rapidly	Do not diffuse
Stability	Pretty stable	Highly stable	Unstable
Settling	Get settled in centrifugation	Do not settle	Settle on their own
Example	Milk, blood, smoke	Salt solution, sugar solution	Sand in water, dusty air

Q3. To make a saturated solution, 36 g of sodium chloride is dissolved in 100 g of water at 293 K. Find its concentration at this temperature.

Answer:

Mass of solute (sodium chloride) = 36 gMass of solvent (water) = 100 gMass of solution = Mass of solute + Mass of solvent = 36 g + 100 g = 136 g Chapter: Is Matter Around Us Pure Class 9 CBSE

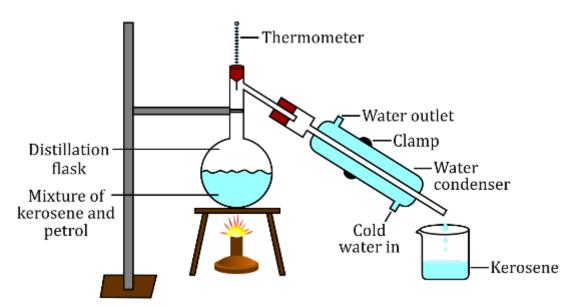

Concentration =
$$\frac{\text{Mass of solute}}{\text{Mass of solution}} \times 100$$

= $\frac{36}{136} \times 100 = 26.47\%$

Exercise 2.3

1. How will you separate a mixture containing kerosene and petrol (the difference in their boiling points is more than 25°C), which are miscible with each other?

Answer:

Distillation can separate kerosene and petrol since their boiling points differ by more than 25 degrees Celsius.

- The kerosene and petrol combination will be poured into a hot distillation flask. Because petrol has a lower boiling point, it will evaporate and create vapours first as the temperature of the mixture rises.
- A condenser condenses the vapours of gasoline and collects them through the condenser output.
- In the distillation flask, kerosene with a higher boiling point will be left behind.

- 2. Name the techniques used to separate the following:
- (a) Butter from curd
- (b) Salt from seawater
- (c) Camphor from salt

Answer:

- a) A process known as centrifugation is used to separate butter from curd. The process is governed by the principle of density.
- b) We can use the simple evaporation technique to separate salt from seawater. Distillation causes water to evaporate, leaving solid salt behind, hence the production of salt.
- c) Sublimation can be used to separate camphor from salt, as during the phase change, camphor does not undergo a liquid phase.

3. What types of mixtures are separated by the technique of crystallization?

Answer: The technique of crystallisation is used to separate solids from a liquid solution. It is linked to precipitation, but in this technique, the precipitate is achieved in a crystal form which exhibits extremely high levels of purity. The principle of crystallization can be applied to purify impure substances.

Exercise 2.4

1. Classify the following as physical or chemical changes:

- Cutting of trees
- Melting of butter in a pan
- Rusting of almirah
- Boiling of water to form steam
- Passing of electric current through water and water breaking into hydrogen and oxygen gases.
- Dissolving common salt in water
- Making a fruit salad with raw fruits, and
- Burning of paper and wood

Answer: The	following is t	ne classification	into physi	ical and	chemical change:

Physical change	Chemical change
 Cutting the trees Boiling of water to form steam Melting of butter in a pan 	 Rusting of almirah Passing of electric current through water, and water breaking into hydrogen and oxygen gases Burning of paper and wood
 Making a fruit salad with raw fruits 	
 Dissolving common salt in water 	

3. Try segregating the things around you as pure substances or mixtures

Answer: Pure substances—Water, bread, sugar and gold.

Mixtures—Steel, plastic, paper, talc, milk and air.

Page 28:

1. Which separation techniques will you apply for the separation of the following?

- (a) Sodium chloride from its solution in water.
- (b) Ammonium chloride from a mixture containing sodium chloride and ammonium chloride.
- (c) Small pieces of metal in the engine oil of a car.
- (d) Different pigments from an extract of flower petals.
- (e) Butter from curd.
- (f) Oil from water.
- (g) Tea leaves from tea.
- (h) Iron pins from sand.

- (i) Wheat grains from husk.
- (j) Fine mud particles suspended in water.

Answer:

(a) In water, sodium chloride in its solution can be separated through the process of Evaporation.

Class 9 CBSE

- (b) The technique of sublimation is apt as Ammonium chloride supports Sublimation.
- (c) Tiny chunks of metal pieces in the engine oil of a car can be manually filtered.
- (d) Chromatography can be used for the fine segregation of various pigments from an extract of flower petals.
- (e) The technique of centrifugation can be applied to separate butter from curd. It is based on the concept of difference in density.
- (f) To separate oil from water, which are two immiscible liquids which vary in their densities, using a funnel can be an effective method.
- (g) Tea leaves can be manually separated from tea using simple filtration methods.
- (h) Iron pins can be separated from sand either manually or with the use of magnets as the pins exhibit strong magnetic quality, which can be a key characteristic taken into consideration.
- (i) The differentiating property between husk and wheat is that there is a difference in their mass. If treated with a small amount of wind energy, a remarkable variation in the moving distance is noticed. Hence, to separate them, the sedimentation/winnowing procedure can be applied.
- (j) Due to the property of water, sand or fine mud particles tend to sink in the bottom as it is denser provided they are undisturbed. Through the process of sedimentation/decantation, water can be separated from fine mud particles, as the technique is established on obtaining clear water by tilting it out.

2. Write the steps you would use for making tea. Use the words solution, solvent, solute, dissolve, soluble, insoluble, filtrate, and residue.

Answer:

- (a) Into a vessel, add a cup of milk, which is the solvent, and supply it with heat.
- (b) Add tea powder or tea leaves to the boiling milk, which acts as a solute. Continue to heat.
- (c) The solute, i.e., the tea powder, remains insoluble in the milk, which can be observed while it is still boiling.
- (d) At this stage, add some sugar to the boiling solution while stirring.
- (e) Sugar is a solute but is soluble in the solvent.
- (f) Continuous stirring causes the sugar to dissolve completely in the tea solution, reaching saturation.
- (g) Once the raw smell of tea leaves vanishes and the tea solution is boiled enough, take the solution off the heat, filter, or strain it to separate the tea powder and the tea solution. The insoluble tea powder remains as a residue while the solute (sugar) and the solvent (essenced milk solution) strain through the filter medium, which is collected as the filtrate.
- 3. Pragya tested the solubility of three different substances at different temperatures and collected the data as given below (results are given in the following table, as grams of a substance dissolved in 100 grams of water to form a saturated solution).

Substance dissolved	Temperature in K				
	283	293	313	333	353
	Solubility				
Potassium nitrate	21	32	62	106	167
Sodium chloride	36	36	36	37	37

achieve excellence	Chapter: Is Matter Around Us Pure	Class 9	CBSE

7					
Potassium chloride	35	35	40	46	54
Ammonium chloride	24	37	41	55	66

(a) What mass of potassium nitrate would be needed to produce a saturated solution of

potassium nitrate in 50 grams of water at 313K?

- (b) Pragya makes a saturated solution of potassium chloride in water at 353 K and leaves the
- solution to cool at room temperature. What would she observe as the solution cools? Explain.
- (c) Find the solubility of each salt at 293 K. Which salt has the highest solubility at this temperature?
- (d) What is the effect of change of temperature on the solubility of a salt?

Answer:

- (a) Mass of KNO₃ to produce a saturated solution of KNO₃ in 100 grams of water at 313 K = 62 g
 - :. Mass of KNO₃ in 50 grams of water at 313 K

$$= \frac{62.0 \times 50}{100} = 31.0 g$$

- (b) Crystals of potassium chloride will be obtained on cooling the saturated solution.
- (c) Solubility of each salt at 293 K is
 - (i) Potassium nitrate → 32 g
 - (ii) Sodium chloride \rightarrow 36 g
 - (iii) Potassium chloride → 35 g
 - (iv) Ammonium chloride \rightarrow 37 g
- (d) On increasing the temperature, solubility of a salt increases.

- 4. Explain the following giving examples:
- (a) Saturated solution
- (b) Pure substance
- (c) Colloid
- (d) Suspension

Answer:

- (a) Saturated solution: It is the state in a solution at a specific temperature when a solvent is no longer soluble without an increase in temperature. Example: Excess carbon leaves off as bubbles from a carbonated water solution saturated with carbon.
- (b) Pure substance: A substance is said to be pure when it comprises only one kind of molecule, atom, or compound without adulteration with any other substance or any divergence in the structural arrangement. Examples: Sulphur, diamonds, etc.
- (c) Colloid: A Colloid is an intermediate between solution and suspension. It has particles of various sizes that range between 2 to 1000 nanometers. Colloids can be distinguished from solutions using the Tyndall effect. Tyndall effect is defined as the scattering of light (light beam) through a colloidal solution. Examples: Milk and gelatine.
- (d) Suspension: It is a heterogeneous mixture that comprises solute particles that are insoluble but are suspended in the medium. These particles that are suspended are not microscopic but visible to bare eyes and are large enough (usually larger than a micrometer) to undergo sedimentation.

Question 5. Classify each of the following as a homogeneous or heterogeneous mixture: soda water, wood, air. soil, vinegar, filtered tea.

Answer:

Homogeneous: Soda water, vinegar, filtered tea.

Heterogeneous: Wood, air, soil.

6. How would, you confirm that a colorless liquid given to you is pure water?

Answer: By finding the boiling point of a given colorless liquid. If the liquid boils at

Chapter: Is Matter Around Us Pure Class 9 CBSE

100°C at atmospheric pressure, then it is pure water. This is because pure substances have fixed melting and boiling points.

7. Which of the following materials fall in the category of a "pure substance"?

- (a) Ice (b) Milk (c) Iron (d) Hydrochloric acid (e) Calcium oxide (f) Mercury
- (g) Back (h) Wood (i) Air.

Answer: Pure substances are: Ice, iron, hydrochloric acid, calcium oxide, and mercury.

8. Identify the solutions among the following mixtures.

(a) Soil (b) Sea water (c) Air (d) Coal (e) Soda water.

Answer: Solutions are: Sea water soda water and air.

9. Which of the following will show "Tyndall effect"?

(a) Salt solution (b) Milk (c) Copper sulphate solution (d) Starch solution.

Answer: Milk and starch solution

10. Classify the following into elements, compounds, and mixtures.

- (a) Sodium
- (b) Soil
- (c) Sugar solution (d) Silver
- (e) Calcium carbonate
- (f) Tin (g) Silicon
- (h) Coal

- (i) Air (j) Soap
- (k) Methane
- (I) Carbon dioxide (m) Blood

Answer:

Elements	Compounds	Mixture
Sodium	Calcium carbonate	Soil
Silver	Carbon dioxide	Sugar solution
Tin	Methane	Coal
Silicon		Air

<u> </u>	, , , , , , , , , , , , , , , , , , , ,	
		Blood

11. Which of the following are chemical changes?

- (a) Growth of a plant (b) Rusting of iron
- (c) Mixing of iron filings and sand (d) Cooking of food
- (e) Digestion of food (f) Freezing of water
- (g) Burning of a candle.

Answer: Chemical changes are:

- (a) Growth of a plant (b) Rusting of iron
- (c) Cooking of food (d) Digestion of food
- (e) Burning of a candle
